Data values

This section is about sending and reading data values.

```
/api/dataValueSets
```

Sending data values

To send data values you can make a POST request to the following resource.

```
POST /api/dataValueSets
```

A common use-case for system integration is the need to send a set of data values from a third-party system into DHIS. In this example, we will use the DHIS2 demo on <http://play.dhis2.org/demo> as basis. We assume that we have collected case-based data using a simple software client running on mobile phones for the *Mortality <5 years* data set in the community of *Ngelehun CHC* (in *Badjia* chiefdom, *Bo* district) for the month of January 2014. We have now aggregated our data into a statistical report and want to send that data to the DHIS2 instance. The base URL to the demo API is <http://play.dhis2.org/demo/api>. The following links are relative to the base URL.

The resource which is most appropriate for our purpose of sending data values is the `/api/dataValueSets` resource. A data value set represents a set of data values which have a relationship, usually from being captured off the same data entry form. The format looks like this:

```
<dataValueSet xmlns="http://dhis2.org/schema/dxf/2.0" dataSet="dataSetID"
  completeDate="date" period="period" orgUnit="orgUnitID" attributeOptionCombo="aocID">
  <dataValue dataElement="dataElementID"
    categoryOptionCombo="cocID" value="1" comment="comment1"/>
  <dataValue dataElement="dataElementID"
    categoryOptionCombo="cocID" value="2" comment="comment2"/>
  <dataValue dataElement="dataElementID"
    categoryOptionCombo="cocID" value="3" comment="comment3"/>
</dataValueSet>
```

JSON is supported in this format:

```
{
  "dataSet": "dataSetID",
  "completeDate": "date",
  "period": "period",
  "orgUnit": "orgUnitID",
```
